Information Systems Technologies Research Outsourcing for You

## Communications, Multimedia and Data Transfer

- Voice-IP phone systems
- Automatic phone call processing system
- Remote desktop and conferencing systems
- Multimedia editors
- Media portals
- Multimedia files converting
- Servers for multimedia systems

In communications, multimedia and data transfer we have developed many innovative products which provide our clients not simply with time&money saving but moreover generate definitive profit measured in hundreds of thousands dollars of revenue. By our observations each dollar invested with us into software development in this area return to clients as 3-7 dollars in revenue. This is the key point why we can be sure that we are one of the best companies in this area of expertise.

## Voice-IP Phone Systems

There are many advantages of having a VoIP telephone system to facilitate communication inside as well as outside the workplace. VoIP phone systems are cost-effective, reliable, easily manageable and scalable. For one of our projects we developed VoIP software that was completely integrated with Microsoft Live Communications Server and provided IM and VoIP services for users.

## Automatic Phone Call Processing System

The competitive advantage of any call processing system is that they automate and therefore provide better customer service, thereby considerably reducing costs for support services. Automatic phone call processing systems employ advanced voice recognition and voice generation modules; they are designed to be able to deal with many problems: customer account information access, product locator, troubleshooting guides, ordering systems, employee or customer PIN/password reset, etc.

## Remote Desktop and Conferencing Systems

The ideal solution for companies with diverse and distributed structure, often spread over different offices and buildings, sometimes regions and even countries, is the use special software, which facilitates the organization of meetings, conferences and training, and allows sharing PC desktop of the meeting organizers between all users. Additional tasks that can be solved with these systems are secure remote access to servers and user computers, from virtually any place on the planet. These systems can also be used for remote technical support, including the diagnostic testing and control of fixed plant and machinery.

## Multimedia Editors

In our company we have accumulated an extensive experience in the development of specialized multimedia editors, which allow designing multimedia presentations and arrange their demonstration according to a special schedule. Such systems are widely used in cable TV companies, by exhibition and conference managers and other companies, which need to design and demonstrate multimedia clips in automatic mode. Our systems have a wide functionality for editing video sequence, voice recording and editing, adding animation effects, supporting various effects of image/objects animation, video formats and remaining at the same time easy to use.

## Media Portals

Today Macromedia Flash SWF is the most popular format for delivering multimedia content through internet. We have extensive experience in the development of different multimedia systems based on Flash Media Server. Using these technologies as well as PHP and ASP.NET, MS SQL Server, MySQL and PostgreSQL databases, we have developed such systems as Video on Demand, Video Blogging & Messaging systems.

## Multimedia Files Converting

The company created a special SDK (Software Development Kit) which allows for the writing of data into SWF. This SDK is used in a number of systems where it is necessary to utilize the SWF format an also in the SWF production server for creating presentations and animations through the web site, for delivering presentations in SWF to client's computers, and for converting documents from Word, MS Excel, HTML and PDF files into SWF.
